

Kakao Login API

인증 과정

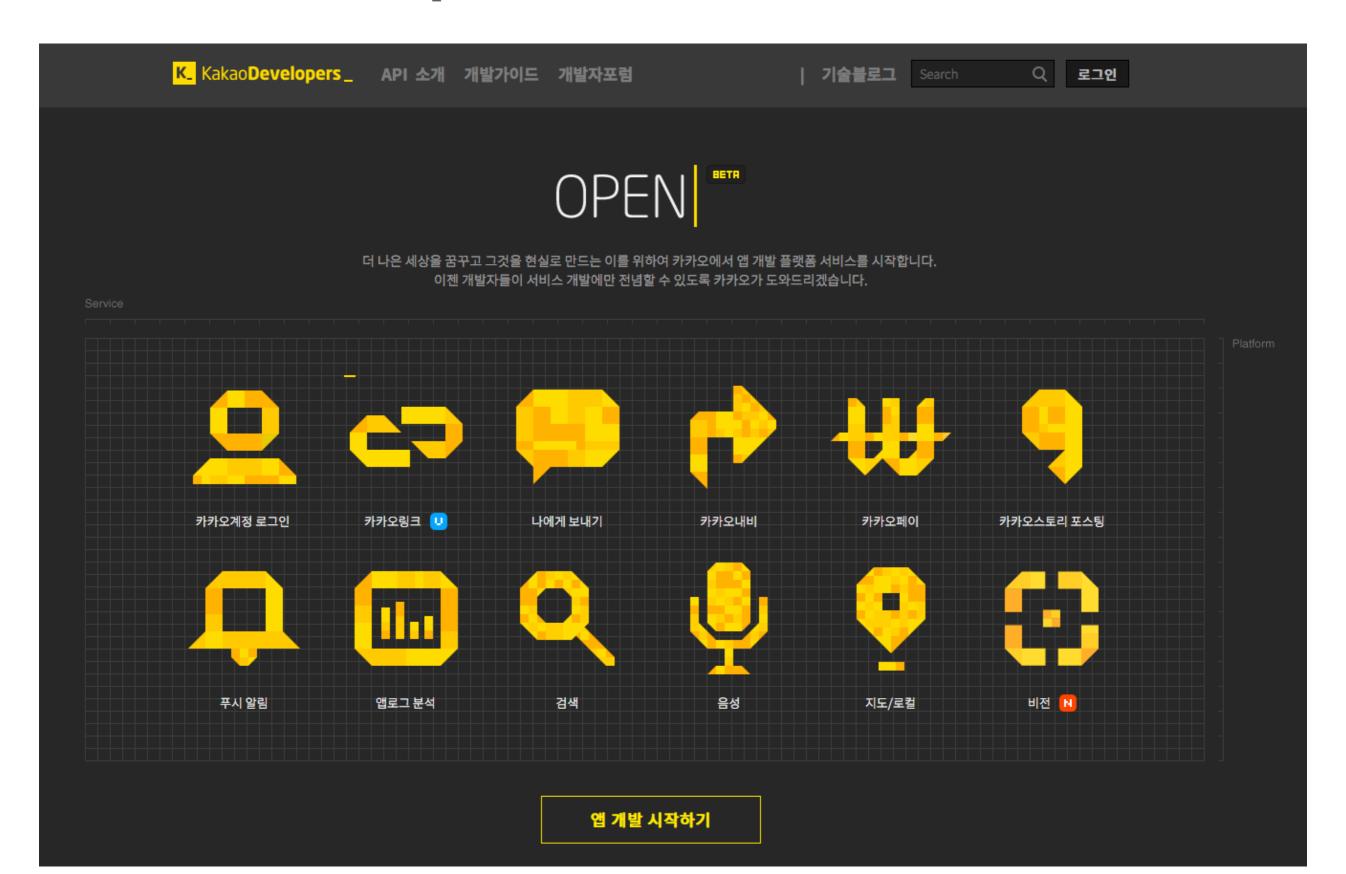

- 1. 사용자가 카카오계정으로 로그인 버튼 클릭
- 2. 카카오톡 앱에 연결된 카카오계정의 자격정보(Credentials)를 통해 사용자 인식
- 3. 자격정보가 올바른 경우 사용자(Resource Owner)로부터 접근 자원에 대한 동의/허가 획득
- 4. 위 3까지 성공적으로 수행되면, 인증 코드(Authorization Code) 발급 해당 인증 코드는 Redirection URI를 기반으로 Third 앱에 전달.
- 5. Third 앱에서는 전달받은 인증 코드를 기반으로 사용자 토큰(Access Token, Refresh Token) 요청

문제 해결

카카오 개발자 웹사이트에 등록한 번들 ID와 실행하려는 앱에 설정된 번들 ID가 다를 경우에는 다음과 같은 에러가 출력되면서 인증이 되지 않습니다.

invalid android_key_hash or ios_bundle_id

 로그인 시도시 '+[NSBundle ko_appKey]: unrecognized selector sent to class 0x111111'의 에러가 발생하면서 앱이 크래쉬 되는 문제

현재 작업중인 프로젝트에서 Other Linker Flags에 "-all_load"가 추가되었는지 확인해 봅니다. 자세한 내용은 Kakao SDK import를 참고합니다.

• Other Linker Flags에 "-all_load"를 추가하였을 경우, 타 라이브러리와의 충돌로 빌드가 실패하는 경우

"-all_load"대신에 "-force_load \$(SRCROOT)/KakaoOpenSDK.framework/KakaoOpenSDK"를 사용하여 Kakao SDK를 강제 로드합니다. <!--

dyld: Symbol not found: OBJC_CLASS\$_NSJSONSerialization

Kakao SDK는 iOS 5.1.1 버젼 이상이 필요합니다. 해당 os의 버젼 확인이 필요합니다. -->

• 웹뷰 등 취소 후 다시 로그인 시도시 "The operation is cancelled."가 반복적으로 나오는 현상

openWithCompletionHandler 호출 전에 [[KOSession sharedSession] close]를 해주는 로직이 빠지지 않았는지 확인합니다. 로그인 예제를 통해 구현을 다시 한번 확인합니다.

로그인 구현

AppDelegate

```
func applicationDidEnterBackground(_ application: UIApplication) {
  KOSession handleDidEnterBackground()
}
func applicationDidBecomeActive(_ application: UIApplication) {
  KOSession handleDidBecomeActive()
}
func application(_ app: UIApplication, open url: URL, options:
[UIApplicationOpenURLOptionsKey : Any] = [:]) -> Bool {
  if KOSession.isKakaoAccountLoginCallback(url) {
    return KOSession.handleOpen(url)
  }
  return false
```

로그인 구현

```
@IBAction private func kakaoLogin(_ sender: UIButton) {
  guard let session = KOSession.shared() else { return }
  // Close Old Session
  session.isOpen() ? session.close() : ()
  session.open { (error) in
   guard session.isOpen() else {
      // Open Session Failed
      return
    // Login Success
```

KOSessionDidChange

```
func sessionDidChangeNotification() {
   NotificationCenter.default.addObserver(
      forName: Notification.Name.KOSessionDidChange,
      object: nil,
      queue: .main
   ) { noti in
      guard let session = noti.object as? KOSession else { return }
      // Code...
   }
}
```
